Abstract: The investigations of flora and fauna in Protected Areas provide important contributions to the knowledge on the status of unmanaged natural ecosystems. In 2017–2019, we studied the vascular plant flora of Behali Reserve Forest (Assam, India). The reserve forest covers 140.16 km² area of semi-evergreen forest. We investigated the taxonomic composition of the flora and diversity of growth forms of species and habitats. In addition, we conducted global IUCN Red List assessment of two endemic species, *Aristolochia assamica* and *Chlorophytum assamicum*. We found that the vascular plant flora of Behali Reserve Forest consists of 281 taxa, including 272 species, one subspecies and eight varieties. They belong to 206 genera and 79 families. Among them, *Pandanus unguifer* was recorded for the first time for the flora of Assam. In growth form spectrum of vascular plants, trees, vines and shrubs predominated, followed by epiphytes, forbs or herbs, geophytes, annuals and parasites. The largest number of vascular plants was found in dense forests, while open habitats were characterized by the smallest species richness. *Chlorophytum assamicum* is assessed as CR B1ab(iii)+2ab(iii); D, and *Aristolochia assamica* as EN B2ab(iii). At the same time, there is a threat of reduction or disappearance of their populations. This is especially crucial for *C. assamicum*, represented by a single world population. Undoubtedly, further investigations of flora could result in an increase in number of the vascular plant flora of Behali Reserve Forest, as well as providing essential insights into population trends of several other species as per IUCN Red List categories and criteria.

Keywords: angiosperms, checklist, foothills, Himalayas, Protected Area, threat status.

Introduction

About 15% of tropical forests play the primary role of biodiversity protection [40] and cover 40% of the world’s wooded areas. Similarly, these tropical forests harbour a considerable proportion of global biodiversity [17, 47, 14, 30]. They occupy about 48,295 km² (7.72%) of the forests of India [42]. The state of Assam comprises diverse vegetation types, hosting a rich biodiversity. Apart from the tropical semi-evergreen forests, several other forest types such as deciduous forests, evergreen forests and swamp forests are prevalent in the region. The *Flora of Assam* [29] still acts as a comprehensive account for the vascular plants of the entire Northeastern India. However, later it was supplemented by several sporadic publications [16, 37, 3, 2], but there is still a lack of accurate data on plant diversity from numerous sub-regions of Assam, including the Protected Areas.

At present, Protected Areas are considered to be the main tool for *in situ* conservation and restoration [21, 28] of biodiversity around the world. In India, the Protected Area network covers 5.02% of the whole geographical area of country, including 104 national parks, 551 wildlife sanctuaries, 88 conservation reserves and 127 community reserves [35]. Although there are several publications on the biodiversity of Protected Areas in Assam, the understanding of its status and diversity still remains incomplete [36]. Among the Protected Areas network, Reserve Forests are the least protected and are generally under very high anthropogenic pressure. So far, little is known about the biological diversity of these Reserve Forests in India, including in the state of Assam. To date, the biodiversity of the several Protected Areas of India is underestimated and such is the case of Behali Reserve Forest (**BRF**). Recently, three new taxa, *Chlorophytum assamicum* D.Borah & A.P.Das, *Aristolochia assamica* D. Borah & T.V. Do, and *Peliosanthes macrophylla* var. *assamensis* N.Tanaka & D.Borah, were described from BRF and *Tupistra stoliczkaniana* Kurz was re-discovered after more than a century [8, 9, 10, 11]. In addition, the existence of a wild *Citrus indica* Yu.Tanaka population has been reported in this Protected Area, although it was previously reported to be extinct in the state of Assam [7]. These reports underpin the need for study of these reserve forests and for analysis of their role in protection of several important and endangered biodiversity elements.

The present study was aimed to study the vascular flora of BRF with special focus on accessing global IUCN Red List status for two endemic plant species.

Material and Methods

Study area

BRF is located in the outermost foothills of the Eastern Himalaya (Fig. 1). It is a part of the Kameng-Sonitpur Elephant Reserve that also includes other Protected Areas of Assam (Balipara Reserve Forest, Charduar Reserve Forest, Nowduar Reserve Forests, Nameri Tiger Reserve) and Arunachal Pradesh (Eagle Nest Wildlife Sanctuary, Pakke Tiger Reserve, Sessa Orchid Sanctuary and Reserve Forests of Khellong Forest Division, Sonai-Rupai Wildlife Sanctuary) [31]. Together with the Kaziranga National Park on its south, BRF acts as a corridor for different animals to the highlands during floods. So far very few floristic studies have been conducted in the Biswanath district [15, 4, 45] and a general account on the local biodiversity of BRF have been published [44] with no mention of its unique flora.

The area of BRF covers 140.16 km² of semi-evergreen forest [46], that falls under the Biswanath district of Assam state, India sharing its boundaries with Buroi River in the East, Borgang river and Singlijan Reserve Forest in the West, Papum Reserve forest in the North, and tea plantations and human habitations in the South [44]. It comprises mostly of plains between 26.866667°–26.950000°N and 93.250000°–93.416667°E and a series of hills on its extreme north. The mean annual temperature is 24.8°C and mean annual precipitation is 1800 mm. The altitude ranges between 90 m a.s.l. to 110 m a.s.l. [44].

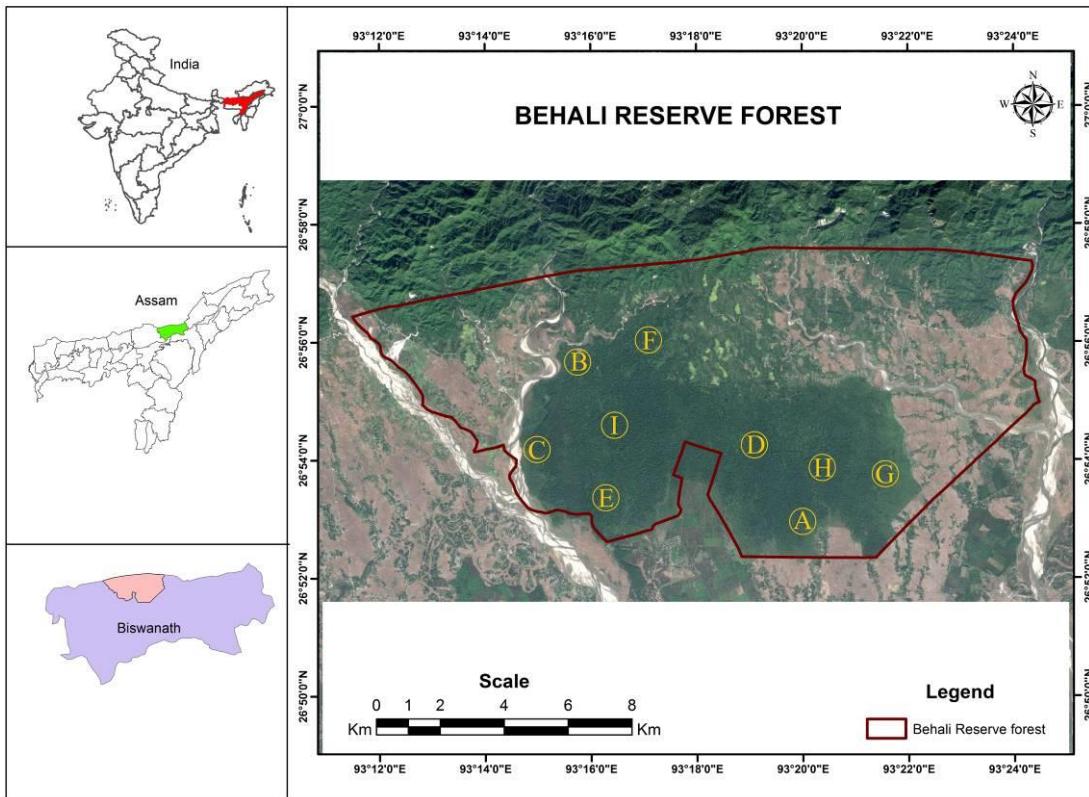

Fig. 1: Map of Behali Reserve Forest and main study sites (defined by letters).

Floristic data sampling and analysis

Extensive floristic surveys were conducted from April 2017 to August 2019. In total, nine study sites were sampled during the field surveys (Fig. 1, Table 1). The Latin names of plants are based on the database POWO [41]. Collected herbarium specimens were identified using available determinant keys [22, 29]. The confusing taxa were identified with the help of taxonomic group specialists. The voucher specimens collected were later processed and mounted into herbarium sheets following the methods of Jain & Rao [27], and then deposited in HAU (Herbarium of Rajiv Gandhi University, India).

Table 1: Description of the study sites in the Behali Reserve Forest.

Site	Dates of the surveys	Protected Area; study site location	Co-ordinates; altitude
A	July 2017; April 2019	Behali Reserve Forest; Bongaon	26.882361°N, 93.333528°E; 103 m a.s.l.
B	June 2018; April 2019	Behali Reserve Forest; Dikal	26.926944°N, 93.267917°E; 98 m a.s.l.
C	April 2017; August 2018	Behali Reserve Forest; Hatidipu	26.900306°N, 93.253389°E; 101 m a.s.l.
D	March 2018; August 2019	Behali Reserve Forest; Hatimara	26.902472°N, 93.322944°E; 97 m a.s.l.
E	April 2018; June 2019	Behali Reserve Forest; Rangagorha Beat	26.886722°N, 93.267111°E; 92 m a.s.l.
F	June 2017; July 2019	Behali Reserve Forest; Radhasu	26.929583°N, 93.281417°E; 95 m a.s.l.
G	July 2018; April 2019	Behali Reserve Forest; Sialmari	26.895389°N, 93.362028°E; 104 m a.s.l.
H	April 2017; April 2019	Behali Reserve Forest; Serelia	26.896972°N, 93.342167°E; 101 m a.s.l.
I	March 2018; August 2019	Behali Reserve Forest; Siklibandha Tiniali	26.906639°N, 93.272417°N; 99 m a.s.l.

To characterize the studied flora, we estimated growth forms of all species and the habitat

types where plants were found. Growth forms were characterised according to IUCN Plant Growth Forms Classification Scheme [24]. To describe habitat diversity, we used the following definitions. 1) Pristine forest (**PF**): unmanaged forest patches with both well-developed canopy and three-tier vegetation. 2) Secondary forests (**SF**): forest patches affected by anthropogenic deforestation, that was resulted in both forest stand and canopy reduction making the illumination intensity as relatively high. 3) Rehabilitated forests (**RF**) are a result of restoration of a degraded forest to its original state by planting native trees. 4) Shrublands (**SH**): shrubby plant community characterized by vegetation dominated by shrubs with participation of grasses, herbs, and geophytes. 5) Riparian habitats (**RH**) are considered as areas along the banks of a permanent or ephemeral water body (river, stream, spring or waterfall). 6) Grasslands (**GR**) are open habitats dominated mainly by grasses, sedges, rushes, being dry or flooded seasonally. The global IUCN Red List categories of each species were indicated following IUCN [26].

IUCN Red List assessment

Assessments of the conservation status of two endemic species, *Chlorophytum assamicum* and *Aristolochia assamica*, for the IUCN Red List followed the recently revised evaluation criteria adopted by IUCN [23, 25], if any one of the IUCN Red List criteria is met. As we have no detailed and reliable population-level data for these plant species, species conservation assessments have been based on IUCN criteria B [13]: an evaluation of range size measured as either extent of occurrence (EOO, criterion B1) or area of occupancy (AOO, criterion B2) followed by an assessment of population fragmentation. In addition, we used criterion D, as an indicator of a very small or restricted population. The extent of occurrence (EOO) and area of occupancy (AOO) were calculated using GeoCAT tool [1]. To make our assessment in line of high-quality global studies, we used recent publications devoted to global and sub-global IUCN assessments of vascular plants [38, 20, 32].

Results

Flora of vascular plants in the Behali Reserve Forest

The flora of Assam state consists of a total 2823 vascular plants which belong to 309 genera, and 107 families [29]. However, in a relatively small area of BRF, 281 vascular plant species are reported, which is equal to about 10% of the erstwhile Assam flora.

During field expeditions, about 347 herbarium specimens were collected in the different vegetation types and communities. They represent 281 taxa (to simplify, hereafter – «species»), including 272 species, one subspecies and eight varieties of vascular plants, which belong to 206 genera and 79 families (Table 2). Of these taxa, *Pandanus unguifer* Hook. f. (Fig. 2) is recorded here as a first report for the flora of Assam.

To date, *P. unguifer* was known from South Sikkim district of Central Himalaya and Darjeeling district of upper West Bengal [49]. This species is closely related to the recently described *P. martinianus* Nadaf & Zanan. It can be distinguished by its globular syncarp with 90–110 randomly distributed drupes (vs. ellipsoid syncarp with 140–160 drupes arranged in rows in *P. martinianus*) [48]. Specimen examined: India, Assam, Behali Reserve Forest, Siklibandha Tiniali 26°54'23.9" N, 93°16'20.7" E, 99 m a.s.l., 12.03.2018, D. Borah (BRF785) (HAU).

Table 2: Native vascular flora of Behali Reserve Forest (Assam, India).

Legend: IUCN Red List categories: CR* - Critically Endangered, EN* - Endangered, VU – Vulnerable, NT - Near Threatened, LC – Least Concern, DD - Data Deficient, NE - Not Evaluated, * - "asterisk" marks taxa evaluated at present study; **Habitat types:** PF- Pristine forests, SF - Secondary forests, RF - Rehabilitated forests, SH – Shrublands, RH - Riparian habitats, GR – Grasslands.

Fig. 2: *Pandanus unguifer* in Behali Reserve Forest (India); inset: syncarp.

The families with highest species number were Orchidaceae (34 species), Lauraceae (20), Moraceae (17), Phyllanthaceae (14) and Lamiaceae (11 species). The richest genera by number of species were *Ficus* and *Litsea* with 13 and 9 species, respectively.

Analysis of vascular plant flora in terms of growth forms demonstrated the predominance of trees (37.0%), followed by vines (18.1%) and shrubs (16.4%), and so on (Fig. 3).

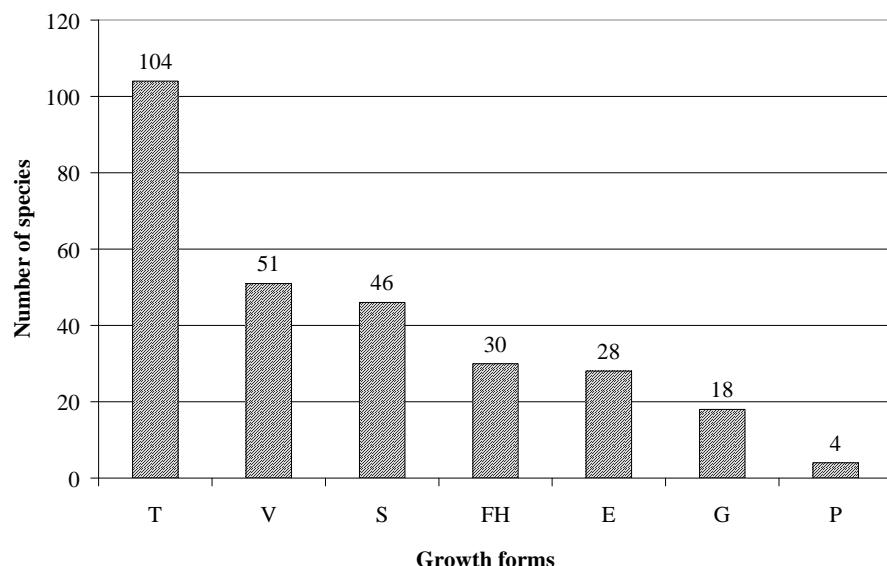

Fig. 3: Distribution of vascular plant species along growth forms. Designations: T – tree, V – vine, S – shrub, E – epiphyte, FH – forb or herb, G – geophyte, P – parasite.

In the present study, we estimated the habitat diversity where the vascular plants grow in the BRF (Fig. 4). We found that the highest number of species was registered in pristine forests (190 taxa) followed by secondary forests (76 taxa) and rehabilitated forests (26 taxa). At the same time, open habitats (e.g. grasslands) were characterized by the lowest species richness.

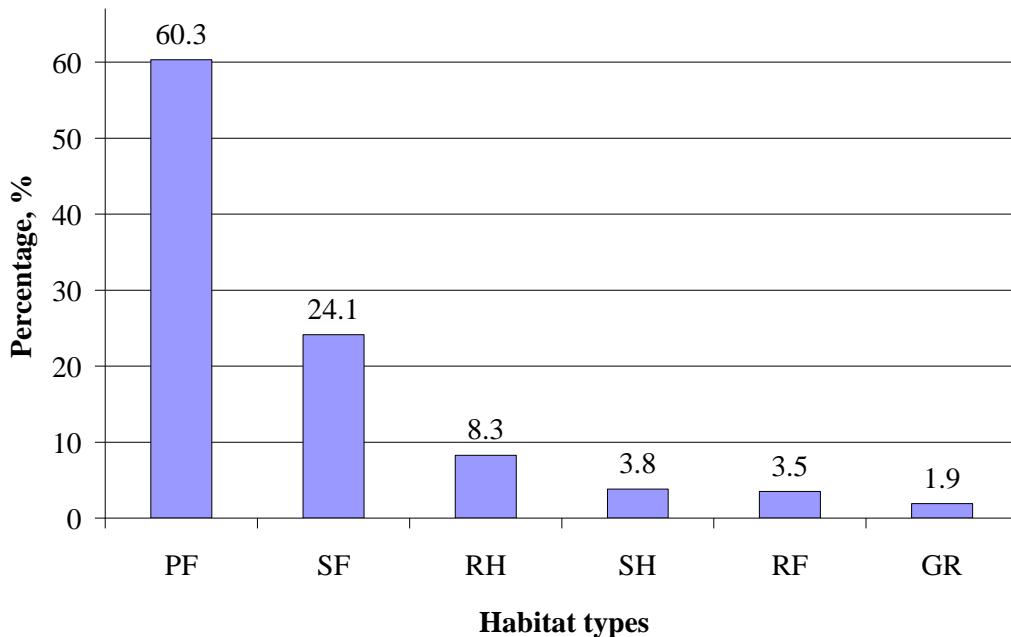

Fig. 4: The proportion of species number per habitat in the Behali Reserve Forest. Designations: PF – Pristine forests, SF – Secondary forests, RF – Rehabilitated forests, SH – Shrublands, RH – Riparian habitats, GR – Grasslands.

Global IUCN Red List assessment of two endemic species

Of 281 taxa in BRF, 58 plants species have global IUCN status [26]. Of these, 54 species are reported as Least Concern (Appendix), two species (*Magnolia kingii* (Dandy) Figlar and *Magnolia griffithii* Hook. f. & Thomson) as Data Deficient, *Elaeocarpus rugosus* Roxb. ex G.Don as Vulnerable, and *Aglaiia edulis* (Roxb.) Wall. as Near Threatened. In this paper, we carried out the global IUCN Red List of two more plant species on the basis of data obtained in North-east India (Fig. 5) during the present study.

IUCN status of Chlorophytum assamicum

Criterion B: There is a single location (Fig. 5C). AOO: 4 km² calculated with a 2 × 2 km-cell fixed grid by GeoCAT programme [1]. Decline in extent and quality of the habitat (iii) has been directly observed and expected to continue in the future.

Criterion D: Number of mature individuals is less than 50.

Category: CR B1ab(iii)+2ab(iii); D.

IUCN status of Aristolochia assamica

Criterion B: AOO: 20 km² calculated with a 2 × 2 km-cell fixed grid by GeoCAT [1]. EOO: 5769 km² calculated with minimum convex hull by GeoCAT [1]. There are five location within the distribution range. Decline in extent and quality of the habitat (iii) has been directly observed and expected to continue in the future.

Category: EN B2ab(iii).

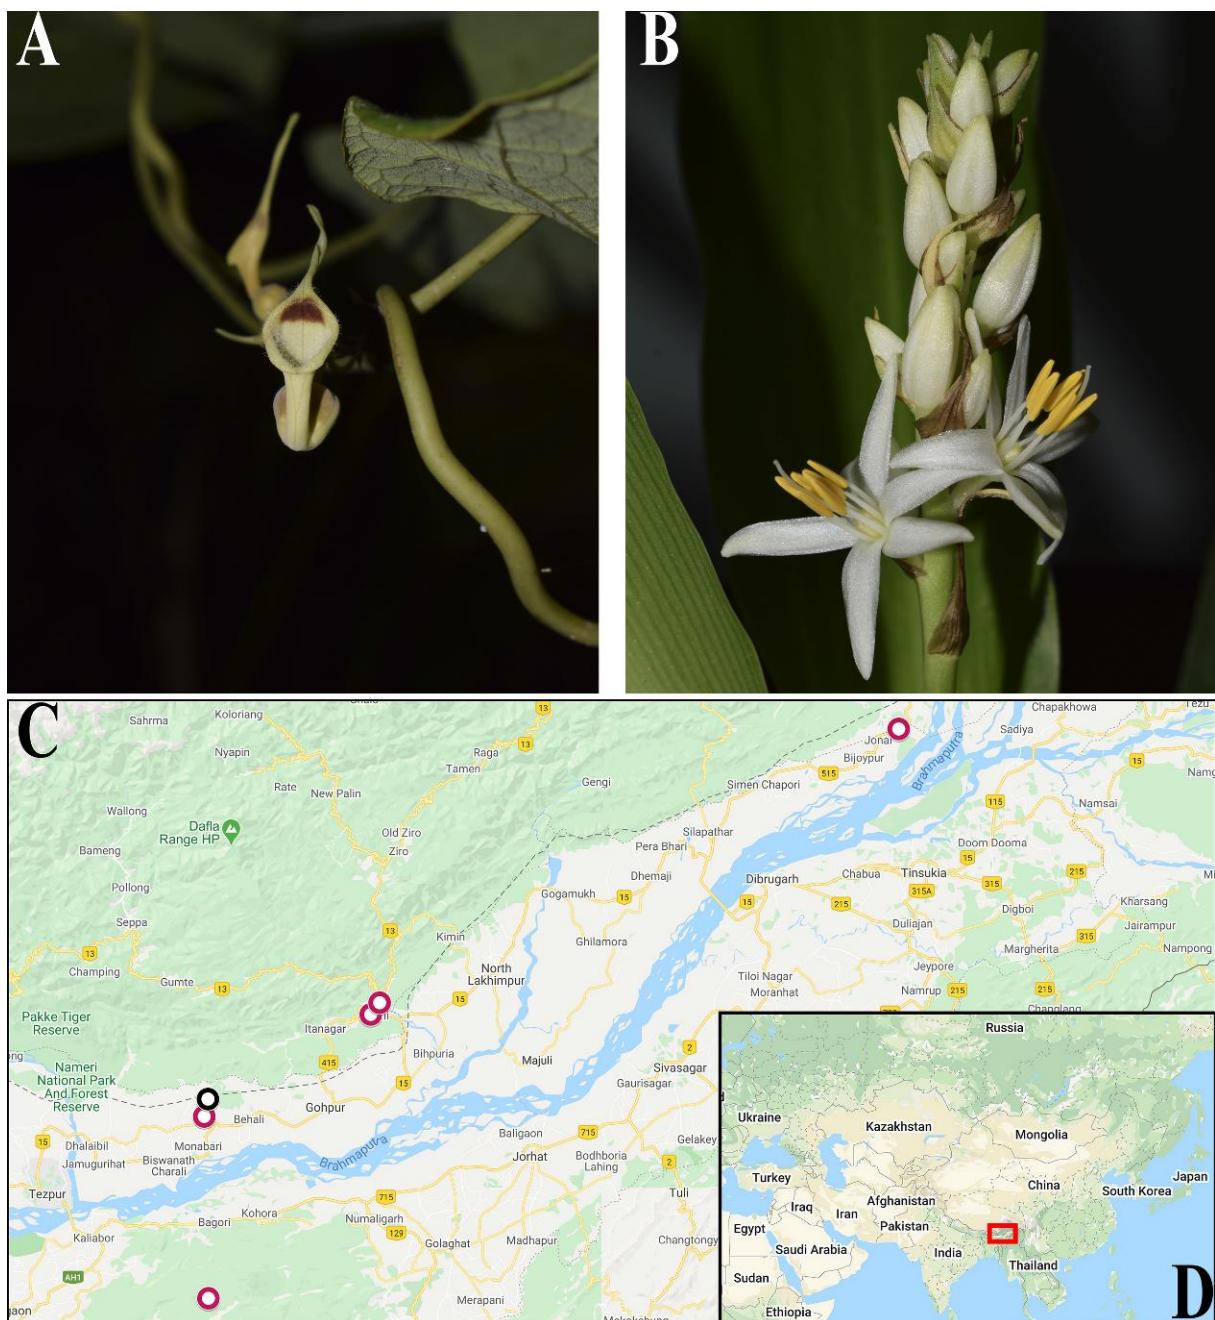

Fig. 5: A – *Aristolochia assamica* (red dots at map C); B – *Chlorophytum assamicum* (black dot at map C); their locations at map of Northeast India (C) and in South Asia (D).

Discussion

The data recorded indicates the presence of a rich floristic diversity in BRF as compared to other forests of Assam state. Though forest has been experiencing tremendous pressure for last few decades, through timber extraction, firewood collection, extension of human settlements, land encroachment and other such destructive activities, still some dense patches have been left in the core regions. The species list obtained is comparable to the studies of Majumdar & Datta [34], Sarkar & Devi [43], Borah et al. [6], Mipun et al. [36] in terms of number of species. At the same time, species richness in BRF is higher than Dutta & Devi [18, 19], Bora & Bhattacharya [5], Borogayary et al. [12], demonstrated in other forests of similar environment within the state of

Assam. Concerning separate families, the predominant Orchidaceae makes the main contribution to epiphyte richness. Perhaps, the relatively lower proportion of orchids in taxonomic spectra is a result of underestimation of epiphytic floras.

In the studied flora, woody plants are predominated with the highest number of trees (104 taxa), vines (51 taxa) and shrubs (46 taxa). It is typical for tropical forests, where trees and shrubs make the most contribution to carbon stock [39]. This is in line with the highest species richness in pristine, secondary and rehabilitated forests. At the same time, we clearly found that the species richness decreased as both openness and disturbance level of a habitat increased. Our results are consistent with data that disturbances and plantation or rehabilitation of forests alter and decline the species composition in a plant community [33].

Results of the conducted IUCN Red List assessments of two endemic species, *Aristolochia assamica* and *Chlorophytum assamicum*, made it possible to continue the search and monitoring of their new locations and future re-assessment of IUCN status. Moreover, now, Critically Endangered *A. assamica* is the 14th species in world and 1st species in South and South-east Asia of the genus *Aristolochia*, which are estimated globally [26]. Finally, it is the 3rd Critically Endangered *Aristolochia* species, while other ten species were previously assessed as Endangered (four taxa), Vulnerable (six taxa), Least Concern (one taxon). *Chlorophytum assamicum* is the 20th species of the genus *Chlorophytum* estimated globally. It is the 3rd globally assessed *Chlorophytum* species in both India and the whole of South and South-east Asia. Finally, *C. assamicum* is a 4th Critically Endangered *Chlorophytum* species assessed at a global scale, while three more *Chlorophytum* taxa were globally estimated as Endangered, one species is Vulnerable, one species is Data Deficient, and, finally, 11 *Chlorophytum* have Least Concern status [26]. Taking into account the high level of species endemism in the tropics and, in particular, in India, we propose a need to estimate more number of plant species according to IUCN Red List categories and criteria in order to fill gaps in knowledge on threats to plant species in the world.

Conclusions

The BRF flora in the state of Assam demonstrates a high habitat diversity represented mainly by forests (pristine, secondary, rehabilitated), which reflects the predominance of woody plants in growth form spectrum. Although the present checklist is not an exhaustive inventory of the BRF (higher sampling effort is necessary to capture total local plant diversity), it serves as a starting point for future floristic and ecological studies in this and the nearest protected and managed areas in North-east Asia. Because during the present studies in BRF, three new species were described, one species was rediscovered after a century, as well as one new record obtained for the flora of Assam state [8, 9]. And at the same time, several such new records of plant species for India and for science are highly possible in future. The global IUCN Red List assessment conducted of two endemic plant species highlights an opportunity to obtain further data on populations of other plant species and throws light on the need for conservation programmes for species recovery through populations built up in native habitats.

FLORA VASCULARĂ NATIVĂ DIN REZERVAȚIA PĂDUREA BEHALI (ASSAM, INDIA) CU EVALUAREA GLOBALĂ ÎN LISTELE ROȘII IUCN A DOUĂ SPECII ENDEMICE

(Rezumat)

Investigarea florei și faunei din ariile protejate aduce contribuții importante la cunoașterea statutului ecosistemelor naturale neadministrate. În perioada 2017-2019, am studiat flora vasculară din Rezervația Pădurea Behali (Assam, India). Rezervația are o suprafață de 140,16 km² și este o pădure semi-semperfivrescentă. Am investigat compozitia taxonomică a florei și diversitatea formelor de creștere a speciilor și habitatelor. În plus, am evaluat două

specii endemice (*Aristolochia assamica* și *Chlorophytum assamicum*) din punctul de vedere al criteriilor din Listelor Roșii IUCN. Rezultatele noastre au arătat că flora vasculară a Rezervației Pădurea Behali cuprinde 281 taxoni, cu 272 specii, o subspecie și opt varietăți. Acestea aparțin la 206 genuri și 79 familii. Printre acestea, *Pandanus unguifer* a fost menționat pentru prima dată în flora din Assam. În ceea ce privește spectrul formelor de creștere, au predominat arborii, lianele și tufărișurile, urmate de epifite, specii ierboase, geofite, anuale și parazite. Cel mai mare număr de specii de plante s-a înregistrat în zonele dense ale pădurii, în timp ce habitatele deschise s-au caracterizat prin cel mai mic număr de specii. *Chlorophytum assamicum* este evaluat ca CR B1ab(iii)+2ab(iii); D, iar *Aristolochia assamica* ca EN B2ab(iii). De asemenea, există o amenințare privind reducerea sau dispariția populațiilor acestor specii. Acest aspect este foarte important mai ales pentru *Chlorophytum assamicum*, reprezentat de o singură populație la nivel global. Cu siguranță studiile ulterioare ar putea pune în evidență un număr mai mare de specii floricole vasculare din Rezervația Pădurea Behali, precum și tendința de dezvoltare a populațiilor altor specii importante din punctul de vedere al categoriilor și criteriilor din Listele Roșii IUCN.
