The MIDDLEWARE CODE:
Samples of the code can be listed here in code mark-up explaining what is truly happening in this first Node.

Rationale Tip:
Why this step might be common in this middleware could be noted here as well. For instance why would the first node record a start time? Because its tracking performance issues.

<http://tympanus.net/Development/ButtonComponentMorph/index2.html>

1

JOURNEY BEGINS

WHAT KIND OF JOURNEY:
A 'GET' REQUEST
A GLOBAL FUNCTION WILL BE CALLED ON EACH STEP THE ICON MAKES TRAVERSING THE PATH BETWEEN EACH NODE

WHEN a User clicks the Play Button (a 'click-function') this calls a global function: 'nextNode();' which dictates the cycles of the animated dot from node-to-node with distinctive logic that is defined by the kind of middleware journey

2

FIRST NODE VISITED

The Raphael var path will be defined by the length between node 0 to node1, where the var circle will be animated along.

WHEN the icon reaches the end of the path to Node1, then another function is called to animate the white line into a box displayed in a modal window.

THE HTML inside the box is not visible and a click function will close the box which after 5 seconds calls the global function to continue the journey of the icon.

3

MODAL WINDOW

The Modal Window will animate the grey Path to a white Box which loads a the sample copy above.

On the click-function that closes the White Box, reactivates the Raphael animation allowing for the user to read the content at their pace.

Once the box is closed, the global function is called and the icon continues on it's journey forward.

4

NOT FOUND

The copy in this White Box may describe that the request or query for the asset is Not Found.

On the click-function that closes the White Box, the muted icons then get visible with a 100% opacity

- The Unhappy Face gets visible
- The path forward is visible

5

IF TRULY NOT FOUND

IF after proceeding from the last node... then the application continues onward after each activation...

On the click-function that closes the White Box, reactivates the Raphael animation allowing for the user to read the content at their pace.

If the Middleware does not succeed then it enters the Rails API... TBD.
