

What is CitizenSpring?

CitizenSpring is an app that brings water quality testing into the 21st century and gives power to the community to identify **safe drinking water** that is **free of lead** and other contaminants.

Using water test kits that are readily available online and at local hardware stores, the CitizenSpring app directly reads the test results and uploads them to a map for every person to see where it's safe to drink.

Why CitizenSpring?

Lead is toxic to the human body and can cause permanent brain damage, especially in children. Reports of unsafe lead levels in schools and homes have recently been popping up across the nation. CitizenSpring makes it simple for people to test their own water and **empowers individuals with information** about patterns of contamination in our communities, making water quality testing more transparent. Rather than waiting for local utilities or government agencies, we can take testing into our own hands and **share our data on a map** to see where it's safe to drink and where we need to direct attention to update our aging infrastructure.

- Protect our children from unsafe drinking water
- See what cities or neighborhoods or buildings are most at risk
- Use the crowdsourced data to demand action from local officials
