2. Display RESET Timing Characteristics

Reset input timing

Timing Parameters

Symbol	Parameter	Related Pins	MIN	TYP	MAX	Note	Unit
t_{RESW}	*1) Reset low pulse width	RESX	10	-	-	-	μs
t_{REST}	*2) Reset complete time	-	-	-	5	When reset applied during Sleep in mode	ms
		-	-	-	120	When reset applied during Sleep out mode	ms

Note 1. Spike due to an electrostatic discharge on RESX line does not cause irregular system reset according to the table below.

RESX Pulse	Action
Shorter than 5 μ s	Invalid Reset
Longer than 15 μ s	Valid Reset
Between 5 μ s and 15 μ s	Reset Initialigation Precedure

Note 2. During the resetting period, the display will be blanked (The display is entering blanking sequence, which maximum time is 120 ms, when Reset Starts in Sleep Out –mode. The display remains the blank state in Sleep In –mode) and then return to Default condition for H/W reset.

Note 3. During Reset Complete Time, data in OTP will be latched to internal register during this period. This loading is done every time when there is H/W reset complete time (tREST) within 5ms after a rising edge of RESX.

Note 4. Spike Rejection also applies during a valid reset pulse as shown below:

Note 5. It is necessary to wait 5msec after releasing RESX before sending commands. Also Sleep Out command cannot be sent for 120msec.

TE Timing Characteristics

Mode 1, the tearing effect output signal consist of V-sync information only:

tvdh = The display is not updated from the frame memory

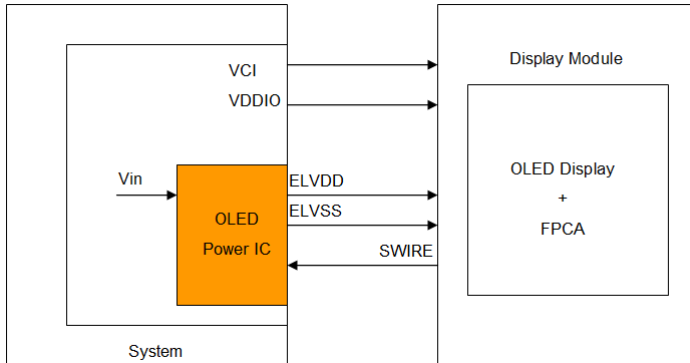

tvdl = The display is updated from the frame memory

Note 1: Ambient temperature =25 °C±2 °C, measured by CA-310

Note 2: To be measured in the dark room.

Note 3: The brightness measurement shall be done at the center of the display with a full white image.

Note 4: Definition of contrast ratio:

Contrast ratio is calculated with the following formula:

$$\text{Contrast ratio (CR)} = \frac{\text{Photo detector output when OLED is at "White" state}}{\text{Photo detector output when OLED is at "Black"}}$$

Note 5: Uniformity. Refer to figure as below

- $\Delta B_p = B_p (\text{Min.}) / B_p (\text{Max.}) \times 100 (\%)$
- $B_p (\text{Max.})$ = Maximum brightness in 5 measured spots
- $B_p (\text{Min.})$ = Minimum brightness in 5 measured spots.

Note 6: Definition of viewing angle :

The optical performance is specified as the driver IC located at =270°

Note 7: The color chromaticity should be based on sample performance because new OLED material should be verified later.

Note 8: Time to 95% Luminance

To measure the burn-in effect, a test pattern with white background applied to the AMOLED display at 100% loading

Note 9: Cross-talk

- There should be no visible cross-talk in normal direction of the display when the two "Cross-talk Test Patterns" below are loaded.
- Measurement equipment: DMS-803 or similar equipments
- The point should be marked is, the background of Cross-talk Test Pattern-"gray" are defined as middle gray scale. For example, RGB 24bit "gray" defined as below:

R7	R6	R5	R4	R3	R2	R1	R0	G7	G6	G5	G4	G3	G2	G1	G0	B7	B6	B5	B4	B3	B2	B1	B0
1	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0

- $\Delta B_{pn} = B_{pn}(\text{gray}) / B_{pn}(\text{white})$
Which n means the dot No. In the Cross-talk Test Pattern ;
B_{pn} (gray) means the brightness of the No.n spots in Cross-talk Test Pattern A and B;
B_{pn} (white) means the brightness of the No.n spots in Full white Test Pattern;
- $\Delta B_p(\text{Max.}) = \text{Maximum value in A1} \sim \text{A4 and B1} \sim \text{B4.}$
- $\Delta B_p(\text{Min.}) = \text{Minimum value in A1} \sim \text{A4 and B1} \sim \text{B4.}$
- $\Delta CT = \Delta B_p(\text{Max.}) / \Delta B_p(\text{Min.}).$
- ΔCT must be less than 1.10

Note 10: Flicker

The flicker level is defined using Fast Fourier Transformation (FTT) as follows:

$$Flicker = 20 \log_{10} \left(2 \frac{f_{FFTC}(n)}{f_{FFTC}(0)} \right) + FS(Hz) \quad (dB)$$

where $f_{FFTC}(n)$ is the nth FFT coefficient, and $f_{FFTC}(0)$ is the 0th FFT coefficient which is DC component. $FS(Hz)$ is the flicker sensitivity as a function of frequency.

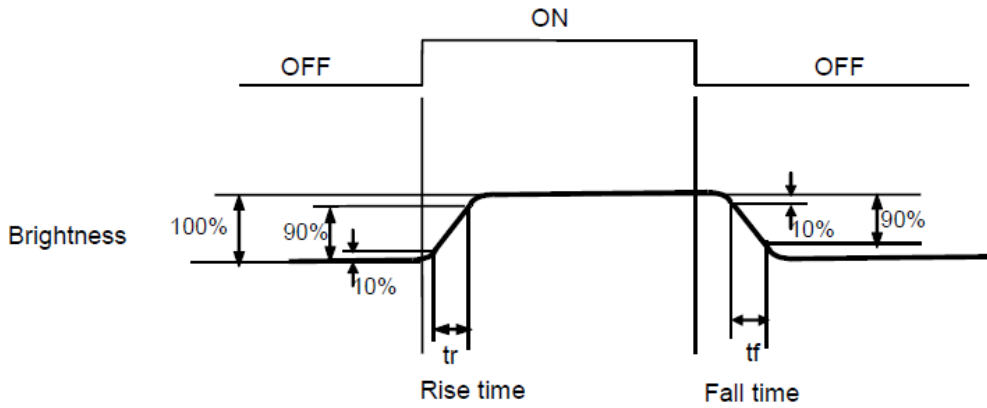

The flicker level shall be measured with the test pattern in below.

The gray levels of test pattern is 128.

Note 11: Optical Switching Time:

The optical switching time measurements should be performed at driven BLACK and driven WHITE at typ. brightness setting by the driving techniques specified. The luminance should be measured with the emitting display and the detector at $\theta=0^\circ$ and $\psi=90^\circ$. The rise time t_r is the time between a 10% optically response of the display and a 90% optically response of the display. The fall time t_f is the time between a 10% optically response of the display and a 90% optically response to the display. The response time is defined as the average of the rise time and the fall time.

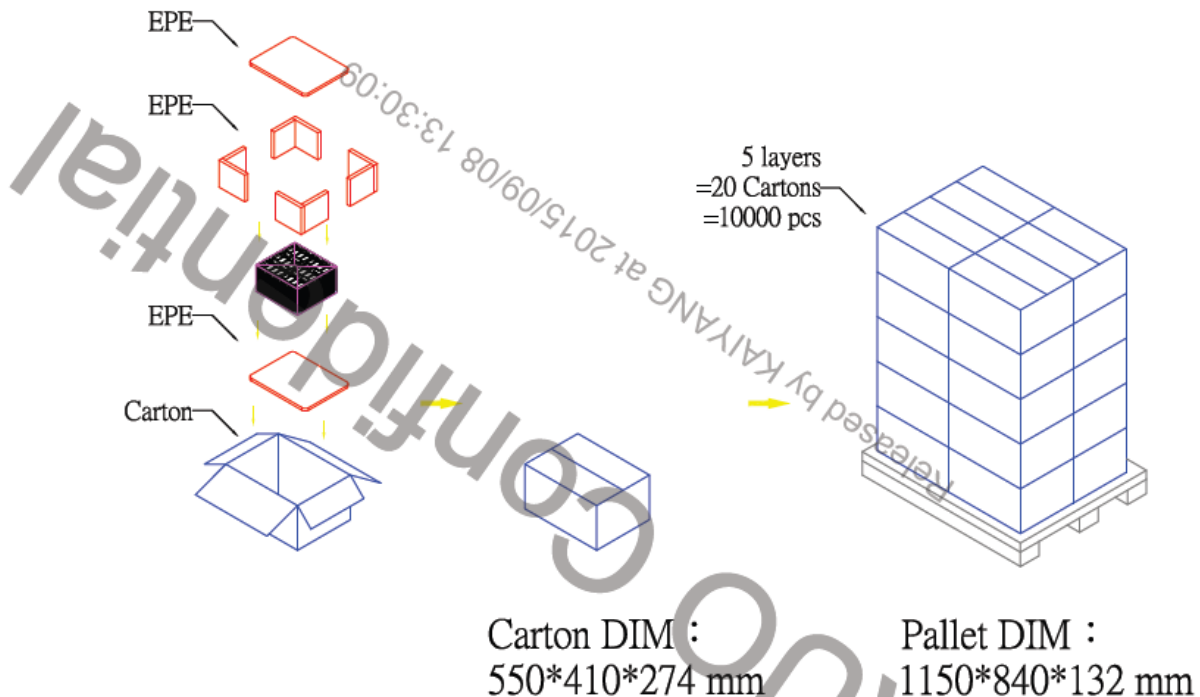

Note 12 : Gamma spec. is based on Gray level 255, 250, 244, 240, 232, 224, 206, 192, 160, 128, 95, 63, 47 & 31.

H. Packing

I. Outline Demension

J. Precaution

Please pay attention to the following items when you use the OLED Modules(Panel):

1. Do not twist or bend the module(panel) and prevent the unsuitable external force for display during assembly.
2. Adopt measures for good heat radiation. Be sure to use the module(panel) within the specified temperature.
3. Avoid dust or oil mist during assembly.
4. Follow the correct power sequence while operating. Do not apply the invalid signal, otherwise, it will cause improper shut down and damage the module(panel).
5. Less EMI: it will be more safety and less noise.
6. Please operate module(panel) in suitable temperature. The response time & brightness will drift by different temperature.
7. Avoid to display the fixed pattern (exclude the white pattern) in a long period, otherwise, it will cause image sticking.
8. Please be sure to turn-off the power when connecting or disconnecting the circuit.
9. Polarizer scratches easily, please handle it carefully.
10. Display surface never likes dirt or stains.
11. A dew drop may lead to destruction. Please wipe off any moisture before using module(panel).
12. Sudden temperature changes cause condensation, and it will cause polarizer damaged.
13. High temperature and humidity may degrade performance. Please do not expose the module(panel) to the direct sunlight and so on.
14. Acetic acid or chlorine compounds are not friends with AMOLED display module(panel).
15. Static electricity will damage the module(panel), please do not touch the module(panel) without any grounded device.
16. Please avoid any static electricity damage (ESD) during producing and operating.
17. Do not disassemble and reassemble the module(panel) by self.
18. Be careful do not touch the rear side directly.
19. No strong vibration or shock. It will cause module(panel) broken.
20. Storage the modules(panel) in suitable environment with regular packing.
21. Be careful of injury from a broken display module(panel).
22. Please avoid the pressure adding to the surface (front or rear side) of modules(panel), because it will cause the display non-uniformity or other function issue.
