

ngArchive

...bridging the gap

REPLACEMENT FOR HP AUTONOMY EAS

- **No Migration:** ngArchive uses a more state of the Art way to store new archived content but delivers already with EAS archived Content directly from the “old” EAS Document Stores without any Migration
- **No Client Impact:** ngArchive offering the ability to convert existing Stubs in Users Mailboxes to the new ngArchive Format, but it is also possible to leave the existing Stubs in EAS Format what is fully supported by ngArchive Client
- **Clientless working Stubs:** The new Stub form contains an http link what makes you able to open archived messages without any client. So Non-Outlook Users (Mac, Unix) or Blackberry Users are now able to retrieve Archived Messages
- **Improved Client Stability:** Our Client is very stable and supports “Self healing”. The Plugin is just a trigger for the “real” Client what is running as an windows Service in the Background. So it also supports “Last Access Time” modification for Cache mode Users
- Supports Oracle, MSSQL, MySQL as Database.
- Supports EMC Centera, Netapps, and all kind of local drives or Network reachable shares.
- Supports Outlook 2003, 2007, 2010 and 2013, Eudora and Thunderbird as Mail App.
- Supports Exchange 2003, 2007, 2010, 2013, SendMail, Postfix as MailServer.
- Supports IDOL, Lucene and many more as Search Provider.
- Brings Apps for iOS and W8 (Android coming soon)
